

Practical No. 11

Name : Danish Altaf Solkar

Enrolment no. : 24111590805

Class : CO - B

Batch : 2

Aim : Prepare Test Cases for Black Box Testing.

1. Aim

To prepare and document test cases for Black Box Testing of an Online Food Ordering System without considering the internal source code or implementation details.

2. Objective

To verify that the Online Food Ordering System accepts valid inputs, rejects invalid inputs, and produces the expected output for major user functions such as registration, login, food search, cart management, checkout, payment, and order tracking.

3. Black Box Testing - Brief Theory

Black Box Testing is a software testing technique in which the tester checks the functionality of a system from the user's point of view. The tester does not need to know the internal code, logic, database structure, or implementation. Test cases are designed using inputs, actions, and expected outputs based on the software requirements.

Common techniques: Equivalence Partitioning, Boundary Value Analysis, Decision Table Testing, and State Transition Testing.

4. Test Environment / Preconditions

- The OnlineFoodOrdering System is installed and accessible.
- The user can access the registration, login, menu, cart, checkout, payment, and order tracking pages.
- At least one food item and restaurant are available in the system.
- A valid customer account is available for authenticated test cases.

5. Black Box Test Cases

TC ID	Module / Function	Test Input / Condition	Expected Result	Status
BB-01	Registration	Enter valid name, email, mobile number and password.	Account should be created successfully and a confirmation message should be displayed.	Pass/Fail
BB-02	Registration	Enter an invalid email address.	System should reject the input and display an appropriate validation message.	Pass/Fail
BB-03	Registration	Leave a mandatory field blank.	System should not submit the form and should identify the required field.	Pass/Fail
BB-04	Login	Enter valid registered email/mobile number and password.	User should be logged in and redirected to the appropriate page.	Pass/Fail
BB-05	Login	Enter valid username/email with incorrect password.	Login should fail and an appropriate error message should be shown.	Pass/Fail
BB-06	Login	Submit login form with blank credentials.	System should display validation messages and should not log in the user.	Pass/Fail
BB-07	Food Search	Search using an existing food item name.	Matching food items should be displayed.	Pass/Fail
BB-08	Food Search	Search using a food item that does not exist.	System should display a suitable 'no results found' message.	Pass/Fail
BB-09	Menu / Browse	Select a restaurant and open its menu.	Available food items, prices and relevant details should be displayed.	Pass/Fail

TC ID	Module / Function	Test Input / Condition	Expected Result	Status
BB-10	Food Details	Open a food item with valid details.	Food name, description, price and availability should be displayed correctly.	Pass/Fail
BB-11	Add to Cart	Add one available food item to the cart.	Selected item should be added and cart quantity/total should update correctly.	Pass/Fail
BB-12	Cart Quantity	Increase item quantity from 1 to 2.	Quantity should become 2 and the item subtotal/total should be recalculated correctly.	Pass/Fail
BB-13	Cart Removal	Remove an item from the cart.	Item should be removed and the cart total should be updated.	Pass/Fail
BB-14	Empty Cart Checkout	Open checkout with an empty cart.	System should prevent checkout and instruct the user to add items first.	Pass/Fail
BB-15	Address	Enter a valid delivery address.	Address should be accepted and available for order delivery.	Pass/Fail
BB-16	Address Validation	Leave a required delivery address field blank.	System should reject submission and show an appropriate validation message.	Pass/Fail
BB-17	Coupon	Enter a valid active coupon code.	Eligible discount should be applied and order total should be updated.	Pass/Fail
BB-18	Coupon	Enter an invalid or expired coupon code.	Coupon should not be applied and an informative message should be displayed.	Pass/Fail
BB-19	Payment	Select a valid payment method and complete payment successfully.	Payment should be confirmed and order should be placed.	Pass/Fail
BB-20	Payment	Payment is declined or fails.	Order should not be incorrectly marked as paid; failure message/retry option should be displayed.	Pass/Fail
BB-21	Order Placement	Complete checkout with valid items, address and successful payment.	Unique order should be created and order confirmation should be displayed.	Pass/Fail
BB-22	Order History	Open order history after placing an order.	Recently placed order and its details/status should be displayed.	Pass/Fail
BB-23	Order Tracking	Open tracking for an active order.	Current order status should be displayed correctly.	Pass/Fail
BB-24	Logout	Click Logout after successful login.	User should be logged out and protected pages should require login again.	Pass/Fail

6. Result

Black Box test cases were prepared for the major functional modules of the Online Food Ordering System. The system can be evaluated by executing each test case and recording Pass or Fail based on the observed result.

7. Conclusion

BlackBox Testing test cases were successfully designed for the Online Food Ordering System. These test cases validate the system from the user's perspective and help identify incorrect validation, functional errors, and unexpected outputs without requiring knowledge of the internal program code.
